Registration for the IMI2 – Call 17 webinars is now open here. They will be held at the end of January. The topics included in the Call are:

- Optimising future obesity treatment

- Open access chemogenomics and chemical probes for
the druggable genome

- Intelligent prediction and identification of environmental risks posed by human medicinal products

The draft topic texts are available on the Future Topics page.

Long-term future Call topics

IMI has also published, on the Future Topics page, indicative information on topics under consideration for inclusion in future Calls (i.e. from IMI2 – Call 18 onwards). The list includes topics in the fields of neurodegeneration; infection control; translational health, clinical trials and oncology; advanced therapies; other research enablers.

Discussions on these topics are still in the earlier stages so the topics may change considerably and they will probably not be ready for inclusion in an IMI Call for months. Furthermore, as the discussions advance, it is likely that some topics will be added to this list while others will be dropped. In any case, we hope that this list will give potential applicants a useful glimpse into what is under development in the longer term, and provide additional time to enhance their network.

We will update the list whenever we have updates on the status of the topics.
